

SectionSearch Class (main):

Calls to the SectionList class the loadSection() method, then the printSections(), and then searchSections(). That is all.

Section Object Class:

Creates an object with all criteria met for the Section, ex. subject, days, time, course, section, CRN, and credits. Object also contains getter and setter method for each of these variables.

SectionList Class:

This class object contains methods to load from "courses.txt" file all the data within it and create Section objects from each line in the file. Also, the class contains a search and print method to find a CRN the user enters and print the entire list of Section objects once created.
